ABSTRACT

A series of 30 telelessons and an accompanying manual designed to train teachers of adult basic education was developed by the Maryland State Department of Education and then utilized and evaluated in 25 colleges and universities throughout the United States. The purpose of the evaluation was to describe the types of courses, students, faculty, and instructional procedures involved, determine the effectiveness of the program, and survey the reactions of faculty, students and state-level personnel to the program. Questionnaire survey forms were used to gather information about the nature of the courses, students and instructors. Evaluation reports were used to gather information from students and faculty about their reactions to each lesson. A criterion referenced test was administered prior to, and at the completion of instruction. Of the 430 students in the 25 schools, 356 completed both pre and post tests. State reports were received from 36 persons. Conclusions demonstrated the value of the program and the feasibility to implement it in a variety of ways and settings. Complete findings, recommendations, and evaluation instruments are included. (WL)

ACKNOWLEDGEMENTS

Curriculum and Evaluation Consultants is pleased to have had the opportunity to conduct the evaluation of the Adult Basic Education Instructional Television Program for the Maryland State Department of Education. The project staff hopes that this study will make some contribution to the improvement of Adult Basic Education throughout the nation.

The evaluation team appreciate the assistance and cooperation of Ms. Sandra Gruetrer, Project Director, in collecting data; Mr. Wayne Wharton of the Adult Education section for arranging for the field test of the criterion referenced test, and Dr. Mohammed Shami of the Division of Research for his advice.

The instructors listed in Appendix B and their students who contributed their time and talent completing the various instruments are the heart of this evaluation. We are most grateful for their cooperation.

The final copy of this report was edited by the Maryland State Department of Education.

The work performed herein was performed pursuant to grant No. V-0023VK from the U.S. Office of Education, Department of Health, Education and Welfare. The opinions expressed in this report do not necessarily reflect the position or policy of the U.S. Office of Education, and no official endorsement of the U.S. Office of Education should be inferred.

INTRODUCTION

A series of 30 telelessons and an accompanying manual clesigned to help train teachers of adult basic education was developed over a two year period (1972–74) by the Maryland State Department of Education (MSDE).

The development of this series, entitled <u>Basic Education</u>: <u>Teaching the Adult</u>, was a cooperative effort of the Adult Continuing Education Section of the Division of Instruction and the Division of Instructional Television of MSDE.

Under a roccial grant from the United States Office of Education, the series was utilized and evaluated in courses to train teachers of adult basic education in 25 colleges and universities throughout the nation during the first half of 1975. This report describes the process and results of the aluation.

11

PURPOSE

The purpose of this evaluation was to describe the types of courses, faculty, students and instructional procedures involved, to determine the effectiveness of the program and survey the reactions of faculty, students and state level personnel to the series.

The study was designed to provide answers to the following questions:

4

- 1. In what types of courses was this program utilized?
- 2. What type of faculty taught these courses?
- 3. What types of students enrolled in these courses?
- 4. What types of learning activities, materials and out-of-class assignments were used in these courses?
- 5. Was there a difference in achievement among learners with various years of learning experience?
- 6. Was there a difference in achievement between learners who have had previous ABE teaching experience and learners who have not?
- 7. Was there a difference in achievement between learners with full time ABE teaching experience and learners with only part-time experience?
- 8. Was there a difference in achievement between learners who have had previous ABE training and learners who have not?
- 9. Was there a difference in achievement between learners who have previously taken a T.V. course and learners who have not?
- 10. Was there a difference in achievement among learner in various geographical locations?
- 11. How did the instructors of the course react to the program?
- 12. How did the students in the courses react to the program?
- 13. How do state department personnel perceive the program?

III PROCEDURES

In order to provide answers to the questions posed in the previous section, it was necessary to select a research design, develop instruments, collect data, identify a population from which to collect data and decide upon the most suitable way to analyze the data.

Design. The original project design planned to compare classes using the T.V. series to a control group of classes covering the same content but not using T.V. or the manual. However, when a control group could not be recruited to participate in the project, both the purpose and design of the evaluation were revised.

In order to gather data about the nature of the course, the instructor and the students, a pre-instructional survey was conducted.

A pre-post test design was used in comparing achievement of various groups in the program.

Continuous reporting at the completion of lessons was the basis for student and instructor evaluation.

Instruments. A variety of instruments were developed to collect data.

These consisted of two basic types; questionnaires and a criterion referenced test.

Each of the questionnaires was developed by members of the staff of Curriculum and Evaluation Consultants (CEC) and critiqued by the project director

and the research division of MSDE. Copies of the Course Information Survey, Student Profile Survey, Instructor Weekly Report, Student Evaluation Form and State Survey are included in Appendix A.

The criterion referenced test was also developed by CEC. Due to a delay in receiving the manuals and revised scripts, the inavailability of a play-back unit for the tapes and the few returns received from a field test by students who had piloted the series the previous spring, the original plan for developing the test had to be modified.

A pool of 148 multiple choice test items referenced to the objectives stated for each lesson in the script, was developed. These were distributed to a group of 35 students, some of whom had seen the tapes before and others who were graduate students in education. Twenty of these were returned completed.

A simplified item discrimination was used as a basis for selecting 85 items for the final form of the test. The first step in this procedure was to separate the tests into two groups based on the number of correct answers to the test. The ren tests with the most correct answers were placed in the high group; the other ten in the low group.

The percentage of persons in each group who answered each question correctly was computed. Those questions in which the percentage of correct answers was greater in the high group than the low group were identified, this resulted in a list of 97 questions.

Since each question was referenced to a specific objective of the program and since the staff wished to sample as many objectives as possible,

the questions were grouped and examined by objectives. Only four of the 75 objectives in the program. Ind no questions which positively discriminated. For the rest of the objectives, a maximum of three and a minimum of one question were selected for the final form of the test. Those items having the greatest difference between the high and low groups were selected with the aforementioned limitations. Thus 85 questions were included in the final form of the test.

For security purposes no copy of the test is included in this report.

Copies are on file with the Adult Continuing Education Section of the Division of Instruction of MSDE.

Population. The project director actively recruited colleges and universities throughout the country to participate in the project. Thirty-two institutions agreed to offer 34 classes which would utilize the television series. A total of 25 participated in the project and 23 returned post tests. A list of 25 schools which contributed some data utilized in this study is included in Appendix B.

No schools could be found to serve as a control group. These courses included 430 students, of which 356 completed both the pre test and the post test.

Not all students or instructors completed all the survey instruments for all the lessons. Comments on some instruments revealed that not all of the tapes were shown in some courses. Unfortunately, it is impossible to determine if missing reports were simply not completed or the tapes not snown.

The project director provided CEC with a mailing list of persons in 56 state and territorial departments of education. A survey soliciting their perceptions of the series was mailed to each one. Those not returning the survey in a month were sent a follow-up letter. A total of 36 surveys (64%) were received.

Analysis. The analysis of variance for repeated measures was the statistical technique used to compare various categories of the population on achievement. Descriptive techniques are used to explain survey results.

FINDINGS

The data collected, the procedures by which they were collected, and the analysis and results are organized according to the questions they answer.

1. In what type of courses was this program utilized?

Each instructor completed a course information form at the onset of the class. A compilation of the 23 forms returned is displayed in Table 1

All courses carried graduate credit, the most common being three semester credits. All but one course met once a week, generally in the late afternoon or evening. The majority of these courses (60%) met on the moin campus.

The tapes were usually shown in class on a self-contained playback unit operated by the instructor. The manual was required reading in most of the classes.

Class size varied, but 91% had less than 30 students. Sixty-nine percent ranged from 10 to 29 students.

Course outlines were prepared for more than half the courses. Textbooks were used in only 22% of the classes.

In summary, all conditions for these courses seemed reasonable, with the possible exception of the once-a-week meeting.

TABLE 1 COURSE INFORMATION

Text required	Yes 5 No 17 Suggested 1

2. What type of faculty taught these courses?

Each instructor was asked to provide information about his/her own background on the course information form. A compilation of these responses are presented Table 2.

Over 75% of the instructors teaching the course were full time faculty at the institution, held the doctorate and had experience teaching ABE learners themselves. Over two-thirds had less than 10 years college experience, and only slightly wer half had pre-college teaching experience. Over three-fourths had expertise in some area of adult education.

Education -	Doctorate
Area of Expertise	Adult Education

3. What types of students enrolled in these courses?

Students were requested at the start of the course to complete a profile sheet (see Appendix A) concerning themselves, their background, experience and opinions about T.V. and ABE. Four hundred thirty profile sheets were received. Although both pre and post tests were received from 356 of these students, all 430 profiles were analyzed in this section. Not all students responded to every question.

Table 3 indicates the number of individuals making each response and the percentage of the total group this represents. Also included are lists of other types of experience and training indicated.

The median age of the group was 35, with 59% being over 30. The group was predominantly graduate level (89%), mostly female (62%) and averaged about 8 years of teaching experience, although 32% had 10 or more years of teaching background. Fifty-five percent had taught ABE; one-third of these had some full-time experience in this area.

Less than half of the group (45%) had any previous training in ABE.

For those who did, about half had college courses and half local inservice work.

A majority of those enrolled in these courses (55%) had previously experienced instruction via television. Only 20% had taken a complete television course, however. One-third of the group had used television in their own teaching before, although in a variety of ways.

Almost all (98%) of these students felt television was a good medium for learning, at least some of the time.

*** Other types of learning involving T.V.
Military
Television production

**** Other uses of T.V. in Teaching
Viewed commercial and P.B.S. programs
Produced T.V. Lesson

Over three-quarters of the group (77%) indicated they do like, or would like to teach ABE, with a smaller proportion (19%) not sure.

In summary, the students who enrolled for this television course in teaching adult basic education are, for the most part, mature, educated and experienced teachers. Many had ABE experience; most liked, or would like to teach ABE. A majority had experience with educational television and feel it is a good medium for learning.

It may be concluded that most of the students enrolled in these courses had the background and attitude that would enable them to benefit from this type of instruction.

4. What types of learning activities, materials and out-of-class assignments were used in these courses?

Instructors were asked to make weekly reports on the lessons covered during the week. Part of these reports dealt with the learning activities other than television used in class, materials used other than the manual, and out-of-class assignments. Tables 4, 5, and 6 indicate the number of instructors reporting various types of activities, materials and assignments respectively.

Table 4 shows that large group discussions and lectures by the instructor prodominate. Following these techniques in frequency of use are small group discussions and individual work by students.

Table 5 reveals that library books, rexts, journals and handouts seem to be the most frequently used materials other than the manuals. Notably absent is the use of many other audio or visual materials.

Table 6 reveals the widespread use of the manuals as an out-of-class assignment. Other assignments rested heavily on reading (text and library).

Since the number of reports returned varied from lesson to lesson, it is not possible to make precise comparisons. However, the frequency of responses reveal trends in each area. The trend is a traditional lecture-discussion-reading approach.

Individual lea...ing activities of students choice – Lessons 1, 2, 3, 4, 5, 6, 11, 12, 13, 14, 15, 16
Complete evaluation of instructional sheets – Lessons 1, 2, 3, 4, 5, 6, 17, 19, 24, 25, 26, 27, 28
Work on individual project - Lessons 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30
Prepare a T. V. presentation – Lessons 1, 2, 3, 4, 5, 6, 7, 8, 9
Critique of group planning – Lessons 4, 7

Critique of group planning – Lessons 4, 7

hardware - Lessons 19, 20, 21, 22

5. <u>Is there a difference in achievement among learners with various years of</u> teaching experience?

Students in these courses were pre and post tested on the criterion referenced test to determine their achievement of the objectives of the series. These tests were analyzed in a variety of ways, one of which was according to teaching experience.

Figure 1 illustrates graphically the change in mean scores from pre to post test for each of pre experience groups (0-1 year, 2-4 years, 4-9 years and 10 or more years). Table 7 contains the mean score and standard deviation in numerical form for each group on pre and post test.

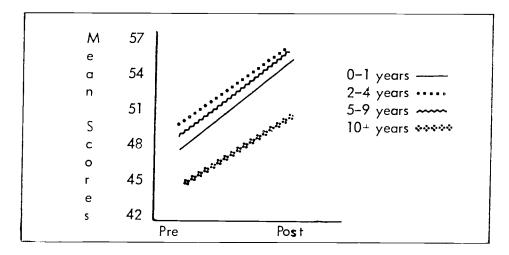

Figure : Improvement (pre to post test means) for learners with different years of experience.

All groups improved from pre to post test. The three groups with less than 10 years experience (0-1, 2-4 and 5-9 years) have both initial and final mean scores that are similar, while the aroup with more than 10 years experience has mean

TABLE 7

MEANS AND STANDARD DEVIATIONS (PRE AND POST TESTS) BY YEARS

OF EXPERIENCE

ears of Experience		Pre	Test	Post	Test
	N		SD*	M	SD
0-1 year	56	47.4	9.1	54.8	10.5
2-4 years	8 <i>7</i>	49.3	9.8	55.9	9.8
5–9 years	83	48.5	8.8	55.0	9.7
10+ years	127	44.2		49.6	10.7
*M = M	ean, SD = Standard	Deviation			

Table 8 presents the results of an analysis of variance for repeated measures of these scores.

TABLE 8

SUMMARY OF ANALYSIS OF VARIANCE OF ACHIEVEMENT SCORES

(PRE TO POST TESTS) BY YEARS OF EXPERIENCE

Source	df	Sum of Squares	Mean Square	F
Between Groups	3	4,095.66	1365.2	8.62**
Error	352	55,754,62	158.4	
Pre – Post	1	7,494.52	7494.5	192.54**
Interaction (groups x time)	3	117.05	39.0	1.00 (NS)
Error	352	13,701.42	38.9	1100 (110)
**Significant at .	01 level	(NS) No	t s i gnificant	

This analysis reveals three facts. First, there is a significant difference between groups across time (F = 8.62). This simply indicates that the groups do differ, but this difference may not be attributed to a change over time (pre to post test). This analysis does not provide information necessary to answer the aforementioned questions. The second fact is that there is a significant difference from pre to post test (F = 192.54). This means that the four groups taken as a whole improved from pre to post test, but it does not indicate which group(s), if any, differed from each other.

The meaningful analysis is between the groups from pre to post test (interaction). In reference to Figure 1 this analysis reveals if there is a significant difference between the slopes of the lines. Simply stated, it indicates if one or more groups made a significantly greater improvement from pre to post tests than other groups. Table 8 reveals that the interaction is not significant (F = 1.00). It may therefore be concluded that although students improved from pre to post test, the number of years of experience did not seem to affect one or more groups more than the others.

6. Is there a difference in achievement between learners who have had previous ABE teaching experience and learners who have not?

Of the 356 students who completed the pre and post test, 211 had previous experience teaching adult basic education (ABE). A graphic illustration of a comparison of their test scores is presented in Figure 2.

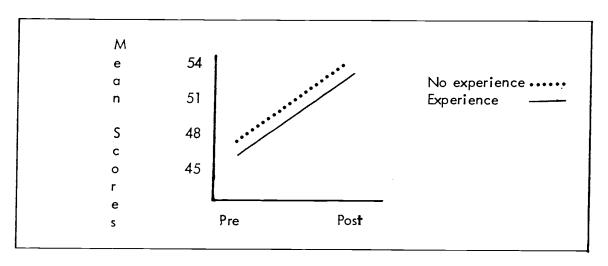

Figure 2. Improvement (pre to post test means) for learners with and without ABE experience.

Table 9 contains the mean and standard deviation of each group on the pre and post test.

MEANS AND STANDARD DEVIATIONS (PRE AND POST TESTS) FOR LEARNERS WITH AND WITHOUT ABE EXPERIENCE

BE Experience	erience		Pre Test		Post Test	
	N	M	SD	M	SD	
Yes	211	47.1	9.8	53.6	10.1	
No	145	46.5	9.5	52.9	10.4	

Both groups achieved mean scores which were similar on both pre and post tests. The results of an analysis of variance for repeated measures on these scores is depicted in Table 10.

SUMMARY OF ANALYSIS OF VARIANCE OF ACHIEVEMENT SCORES
(PRE TO POST TESTS) FOR LEARNERS WITH AND WITHOUT ABE EXPERIENCE

Source	df	Sum of Squares	Mean Square	F
Between Groups		77.0	77.0	.46(NS)
Error	354	59,733.24	168.9	` ,
Pre – Post	1	7,494.52	7494.5	192.02**
Interaction (groups x time)	1	1.91	1.9	
Error	354	13,816.57	39.0	.05(NS)
**Significant at .01 l	evel	(NS) Not s	ignificant	

This analysis reveals there is no significant difference between groups across time (F = .46). This indicates that without reference to time (pre to post test) the groups do not differ from one another. However, both groups taken together show a significant change from pre to post test (F = 192.02). Again, the meaningful analysis is between groups from pre to post test (interactions). This analysis is not significant (F = .05) leading to the conclusion that learners with experience did not improve significantly more from pre to post test than did learners with no experience.

7. <u>Is there a difference in achievement between learners with full time ABE</u> experience and learners with only part-time experience?

Of the 211 persons in these courses who had ABE experience, 64 had full-time teaching experience and 147 had part-time experience. The mean improvements of these two groups is indicated in Figure 3, with the actual mean scores and standard deviations presented in Table 11.

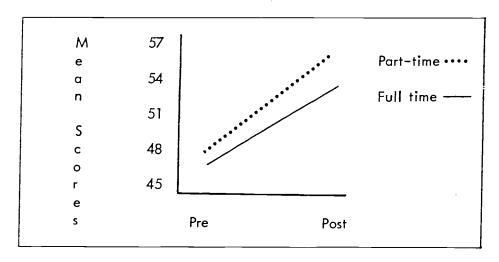

Figure 3. Improvement (pre to post test means) for learners with full and part-time ABE experience.

MEANS AND STANDARD DEVIATIONS (PRE AND POST TESTS)
FOR LEARNERS WITH FULL AND PART-TIME EXPERIENCE

ABE Experience		Pre Test	Post Test	
<u> </u>	N	M SD	M	SD
Full time	64	46.6 10.0	52.7	11.5
Part-time	147	47.5 11.1	55.2	10.9

TABLE 12

SUMMARY OF ANALYSIS OF VARIANCE OF ACHIEVEMENT SCORES (PRE AND POST TESTS) FOR LEARNERS WITH FULL AND PART-TIME ABE EXPERIENCE

Source	df	Sum of Squares	Mean Squares	
Between Groups	1	254.79	254.8	1.34(NS)
Error	209	39,731.04	190.1	` ,
Pre to Post	1	4,552.12	4,552.1	101.72**
Interaction (group x time)	1	62.41	62.4	1.40(NS)
Error	209	9,352.47		, ,
**Significar	nt at .01	level (NS)	Not significant	

An analysis of variance for repeated measures performed on these scores is summarized in Table 12. This analysis reveals no difference between groups across time (F=1.34). However there is a significant difference between pre and post tests considering both groups together (F=101.72). The interaction between groups and time is not significant (F=1.40) leading to the conclusion that improvement from pre to post test was not different for the two groups.

8. Is there a difference in achievement between learners who have had previous. ABE training and learners who have not?

Forty-five percent of the learners in this study who completed the course had previous ABE training. The mean scores of the learners who had previous training were compared with the mean scores of those who did not to determine what effect this training may have had on achievement in this course. These scores are graphically presented in Figure 4 and numerically in Table 13.

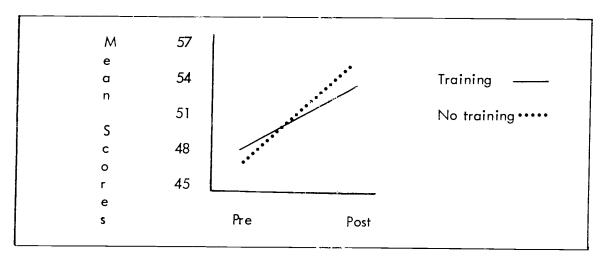

Figure 4. Improvement (pre to post test means) for learners with and without previous ABE training.

TABLE 13

MEANS AND STANDARD DEVIATIONS (PRE AND POST TEST MEANS) FOR LEARNERS WITH AND WITHOUT PREVIOUS ABE TRAINING

	Pre Test	Post Test
N 196 160	M SD 47.4 9.8 46.4 9.5	M SD 52.5 10.8 54.2 10.5
	196	N M SD 196 47.4 9.8

Learners with no experience have a slightly lower mean pre test score than those with previous training, but have a higher mean post test score.

An analysis of variance for repeated measures, in Table 14, indicates that there is no difference in the two groups across time (F = .34). However, there is a significant difference in the mean pre and post test scores (F = 197.93) taking both groups together.

A significant interaction between groups and time (F = 10.94) is the important statistic. An inspection of the mean scores suggest that those students who had no previous training improved significantly more from pre-to-post test than did those with previous training.

TABLE 14

**Significant at .(01 level	(NS) Not	significant	

9. <u>Is there a difference in achievement between learners who have previously</u> taken a television course and learners who have not?

Students in these courses who had taken a previous course or courses in which television was used were compared with students who had no previous experience with a television course to determine if the prior experience with television had any influence on achievement.

The mean pre and post test scores are presented in Table 15 with a graphic representation in Figure 5.

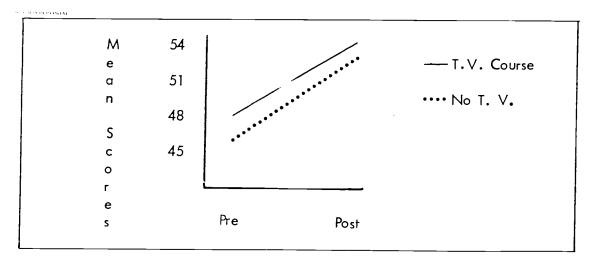

Figure 5. Improvement (pre to post test means) for learners who have and have not taken a T.V. course

MEANS AND STANDARD DEVIATIONS (PRE AND POST TESTS)
FOR LEARNERS WHO HAVE AND HAVE NOT TAKEN A T.V. COURSE

Previous T.V. Course		Pre Test		Post Test	
	N		SD		SD
Yes	169	48.0	9.5	54.0	10.9
No	187	45.6	9.7	5 2. 5	10.4

An analysis of variance for peated measures of these scores is presented in Table 16.

TABLE 16

SUMMARY OF ANALYSIS OF VARIANCE OF ACHIEVEMENT SCORES
(PRE AND POST TESTS)

FOR LEARNERS WHO HAVE AND HAVE NOT TAKEN A T.V. COURSE

Source	df	Sum of Squares	Mean Squares	
Between Groups	1	677.75	6.8	4.06*
Error	354	59,172.53	1.7	
Pre - Post	1	7,494.52	7,494.5	2.51**
Interaction (groups x time)	1	37 . 32	3.7	.96(NS)
Error	354	13,781.16	3.8	(
*Significant at .05 level	**(Significant at .01 lev	vel (NS) Not sig	nificant

The analysis indicates that there is a significant difference between groups across time (F = 4.06) and from **pre** to post tests taking the two groups together (F = 192.51) but there is no significant interaction between groups and time (F = .96). This result leads to the conclusion that there is no difference between the two groups in improvement from pre to post test.

10. <u>Is there a difference in achievement among learners in various geographical</u> locations?

The schools participating in this study were divided into ten geographical regions. The 23 schools that completed both pre and post tests represent eight of these ten regions. The schools and their regions are listed in Appendix B.

It was desired to compare the achievement of learners in the various regions. Figure 6 depicts the change in mean scores for each region from pre to post test and Table 17 contains the actual means and standard deviations of these scores.

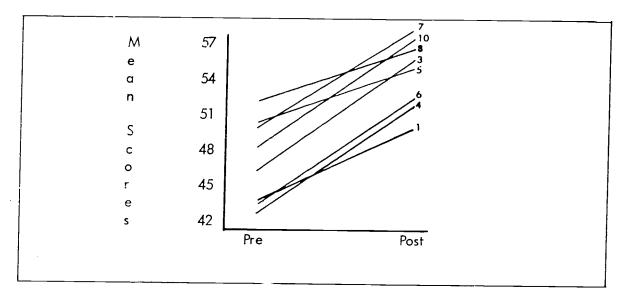

Figure 6. Pre to post test improvement for each geographical region.

Pre test means vary from 42.9 to 52.2; post test means vary from 49.8 to 57.8.

TABLE 17

MEANS AND STANDARD DEVIATIONS (PRE AND POST TESTS)
FOR EACH REGION

	No. of	No. of	Pre	Test	Post T	est
Region 	Students 	Schools	M	SD	M	SD

8	26	2	52.2	8.5	55.5	6.5
10	61	3	48.2	7.1	56.2	9.4

An analysis of variance for repeated measures of these scores is summarized in Table 18.

TABLE 18

SUMMARY OF ANALYSIS OF VARIANCE OF ACHIEVEMENT SCORES

(PRE TO POST TESTS)

BY GEOGRAPHICAL REGION

Source	df	Sum of Squares	Mean Squares	F
Between Groups	7	5 , 587 . 38	798.2	5.12**
Error	348	54,262.90	155.9	
Pre - Post	1	7,494.52	7,494.5	197.35**
Interaction (groups x time)	7	13,215.88	86.0	2.27*
Error	348	•	37.8	
**Significant at	.01 level	* Significant at .	05 level (NS) N	ot significant

The analysis indicates a significant difference among the groups across time (F=5.12) and for the group as a whole from pre to post tests (F=197.35). The interaction of groups and time is also significant (F=2.37) at the .05 level of confidence,

leading to the conclusion that there is a difference in pre to post test achievement among the regions.

Many factors could have influenced his variation, from the fact that some schools did not use all the telelessons, to the unknown abilities of the learners to profit from this type of instruction. However, this evaluation was not designed to detect these reasons.

11. How did the instructors of the courses react to the program?

Instructors were requested to complete weekly reports which included evaluations of the relevancy of each telelesson, how well it communicated, how interesting the presentation was, the strengths and weaknesses of each tape and the usefulness of that section of the manual pertaining to the lesson viewed. A copy of this weekly report is reproduced in Appendix A.

Unfortunately, not all instructors completed reports on all lessons.

Five schools failed to submit any reports and six others returned less than half of them.

Comments on some student evaluation forms indicated that some tapes were not shown.

It is impossible to determine if the missing reports were due to a failure to use the tapes or failure to complete the reports.

Between 11 and 16 reports were received for each of the lessons. A compilation of the responses and the percentages of those making each response are presented in Table 19.

Every tape was rated as being relevant, communicating clearly and presenting the content in an interesting manner. Some tapes were rated slightly lower on some criteria than the rest of the tapes. An examination of the table will indicate these isolated evaluations.

An evaluation of the manuals indicated that they filled in gaps left by the tapes, extended the ideas on the tapes and were occasionally repetitious, but very seldom were they evaluated as adding little to the lesson.

*Other comments on student manual
Clarified meaning – Lessons 1, 2, 3, 4, 8

Emphasized tape – Lessons 5, 6, 7

Material referred to on tape as being in manual was not in manual – Lesson 11

Table 20 summarizes the strengths and weaknesses of the tapes as perceived by the instructors of these courses. Since the statements in this table were generated by the instructors, they tended to vary widely. Because of this variation, and the relatively small sample, no frequency count for each statement is reported since they would be too low to be meaningful.

TABLE 20

STRENGTHS AND WEAKNESSES OF TAPES AND OTHER COMMENTS

- 1		
Other Comments	-Enjoyed; very satisfied -Monual excellent supplement -Pre-test was too long	-Added textbooks by Knowles -Could be divided into several areas -Good manual
Weaknesses	-Repeated reference to Maryland situation unrecessary -Poor tape quality -Too basic -Unrealistic class-size -Repetitious introduction -Stereotyped students involved -Tape unsuccessful in communicating what its like to be an ABE learner	-Knowles dull -Too much material to cover in 30 minutes -Poor tape quality -Too much discussion by consultants -Using actors instead of ABE students -Unrealistic class size -Negative attitude of Knowles to ambition of ABE students -Consultant didn't wrap up concept
Strengths	-Informality of presentation -"How-to"element -Fine introduction -Information about % of adults with only 8th grade education -Brenda Holmes gocd moderator -Broad approach -Excellent variety	-Broad characteristics -Guests -Informality of presentation -Knowles good -Lesson content appropriate -Demonstration by teacher of Knowles points was effective
Lessons	-	5

TABLE 20 (cont.)

-Well developed manual s -Manual-page 38 erlarge type to get point across		-Excellent samples in manual
-Kidd condescending -Using actors instead of ABE students -Unrealistic class size -Point of reaction time confusing	-Weakness using actors not ABE students -Unrealistic class size -Need more tape to meet number of concepts in manual -ABE students put on "spot" -Do not relate to ABE centers -Consumer education orientation misleading	-Condescending attitudes of teachers -Weakness using actors instead of ABE students -O.eremphasis of outlining -Too much lecture; skimmed over important points -Put ABE students on "spot" -Actors changed but kept same name -Threw off sequence -Teacher was too structured
-Positive approach to adult learning -Variety of presentations -Informality of presentation -Kidd good -Kidd's discussion of physiological changes of adults -"How-to" elements	-"Why Don't teachers know all the answers?" point -Guests -Informative -Good introduction -Good content -"How to" element was good -Kidd was excellent	-Guests -Students questionnaire -Excellent format -3 techniques (contract, sentence completion and "buzz group") -Leonard Nadler good

TABLE 20 (cont.)

	-Appropriate amount of stress on teaching inferences -GED rules vary among states	-Should consider problem of oral communication -Class increased scores	-Final topic should give overview without repetition -Comments from state department representative on organization information explained major emphasis of course
-Should condense -Demonstration of "paid assistant" irrelevant -Injustice to role of paraprofessional -Poor attitude to para by teacher	-How long should test period cover? -Interpretation of results can vary		-Conclusion not effective -Stressed statistics too much
-Practical, positive approach -Clarification of roles of assistants -Good paraprofessional choice	-Content and techniques good -Student testimonials -Need to familiarize student with test-making procedure -Emphasized proper information GED explanation	-Good multi-sensory -Technique good -Stress using experts	-Overview from national and state levels
27	28	29	30

The comments reported in this section were generally pointed, indicating in many cases exactly what was good and what was weak in each tape. Strong points throughout the series seemed to be the content presented, the guest consultants and the demonstrations and examples presented. Weak points repeatedly mentioned were the unrealistic class size* used in the demonstrations, the irrelevancy and verbosity of some consultants, and the fact that the tapes may have been too basic for the sophistication of many learners in these courses.

Numerous comments were made about the usefulness of the manuals.

In fact, the manuals may have been useful or more so than the tapes themselves.

In summary, instructors' responses were generally favorable towards both the tapes and the manuals. The survey, along with the student evaluation in the next section, tends to identify strong and weak points in each tape which could be useful if revisions are made. The information reported in this section could also be used by instructors in selecting tapes for use in courses and workshops.

^{*}Respondents were unaware that class size was determined for effective television production with the intent that it be a demonstration. All lessons had been previously field-tested by the teacher in an actual ABE class.

others. Many of those that were returned were not complete; some questions were answered and some were not. The final question concerning other learning activities was misinterpreted by a large number of students. Since the responses to this question were irrelevant they were deleted.

Comments by some students lead to the conclusion that not all the tapes were shown. This fact may explain why reporting was inconsistent.

Table 21 summarizes the evaluations of students on the objective phase of the questionnaire.

At least 75 percent of the responding students felt that they had learned something new from all of the lessons while over 50 percent felt they learned quite a bit from 25 of the lessons.

At least 75 percent rated every tape as communicating very clearly or fairly clear with over 50 percent indicating the top category (very clear).

Ninety percent or more of the students found the content of every tape was presented in an interesting manner. Never did the number of students rating a spe as boring exceed ten percent.

A large proportion of the students felt the manuals filled in gaps and extended the ideas on the tapes. Only a small percentage felt they added little to their learning.

Student perceptions of the strong and weak points of each lesson are summarized in Table 22. Only comments made by at least three students are included in this table.

Many more strong points were noted than weak points. Content and guest consultants were the most frequently mentioned strong points throughout the series. Unrealistic acting was the only recorning weak point. It should be noted that comments about strengths and weaknesses became fewer in the latter half of the series. This decline is to be expected as course pressures and fatigue set in.

Student evaluations were generally quite positive for all lessons. If the acceptance of this group is typical, this series should be a welcome innovation in ABE teacher training.

13. How do state department personnel perceive the program?

The use for this television program is not limited to college and university courses. It's potential use includes both training and orientation purposes at state and local levels.

In order to determine the current and future use of this program in the various states, a survey questionnaire was developed and sent to directors of adult education in 56 states and territories of the United States.

A compilation of the results of the 36 units that replied to this survey are summarized in Table 23.

All but two (94%) were aware of the existence of this series and over half (55%) are currently using the program in their states. Ten of the remaining 16 respondents would like to acquire the series.

Of the twenty states in which the tapes were being used, nine were using them only in university courses. The other eleven were using them in a variety of ways, predominantly in workshops conducted by the states. The tapes were used with a wide range of personnel, chiefly ABE teachers and program coordinators.

General orientation, skill development and interest stimulation were the basic purposes for which the program was used.

The manual was used in many different ways with no single predominant way.

Viewer reaction was positive and enthusiastic. It was recommended that some tapes be revised, supporting findings noted in both the instructor and student evaluations.

63

Table 23

SURVEY OF STATES

Aware of existence of felev	ision series:	Yes 34	No 2
Currently using tapes in stat	es:	Yes 20	No 16

TABLE 23 (continued) Plans for future use Not sure yet 4 2 State Department of Staff Development 1 1 1 Problems concerning use of tapes Need 2 inch tapes for state broadcasting. No adult education training program in state. E.T.V. arrangement in state precludes use. Cannot get regional staff off dead center.

Four persons recommended the use of individual tapes instead of the entire series.

Local inservice programs were most frequently mentioned for future uses of the tapes.

This survey leads to the conclusion that in its short life span, the MSDE program, Basic Education: Teaching the Adult has spread rapidly throughout the country and is being used in a variety of ways.

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

A series of 30 telelessons and an accompanying manual designed to train teachers of adult basic education was developed by the Maryland State Department of Education.

This series was utilized and evaluated in 25 colleges and universities throughout the United States in the spring of 1975. The purpose of the evaluation was to describe the types of courses, students, faculty and instructional procedures involved, determine the effectiveness of the program, and survey the reactions of faculty, students and state-level personnel to the program.

Questionnaire survey forms were used to gather information about the nature of the courses, students and instructors. Evaluation reports were used to gather information from students and faculty about their reaction to each lesson. A criterion referenced test was administered prior to, and at the completion of instruction. Survey and lesson evaluation data were analyzed descriptively and test data by an analysis of variance for repeated measures.

A total of 430 students in the 25 schools participated in this program.

356 completed both the pre and post tests. State reports were received from 36 persons.

The findings of this evaluation have led to the following conclusions:

- 1. These tapes and manuals can be used to teach both graduate and undergraduate students in a variety of settings.
- 2. Well-trained and experienced faculty taught the courses in this project.

3. Mature students with a wide variety of experience and backgrounds participated in these courses.

4.

in conjunction with the tapes to teach these courses.

A traditional lecture-discussion-reading approach was used

- 5. There is no difference in achievement among students with different levels of teaching experience.
- 6. There is no difference in achievement between learners with and without prior ABE experience.
- 7. There is no difference in achievement between learners with full and part-time ABE experience.
- 8. Students with no prior ABE training achieve more than students with previous training.
- 9. There is no difference in achievement between learners who have or have not taken a television course previously.
- 10. Students from various geographical regions differ in their achievement in this program.
- 11. Instructors generally reacted favorably to the program.
- 12. Students generally reacted favorably to the program.
- 13. A number of states are using or would like to use the program.

The conclusions reached in this study are limited to the population involved. A number of uncontrolled variables such as the number of tapes shown in courses, other learning experiences, and student variability make generalization beyond this group tenuous.

However, the value in this study does not lie in its predictive ability.

Its true importance is in the demonstration of the feasibility to implement this program in a variety of ways and settings, and in the evaluation of this experience by faculty and students. The generally positive reaction of these two groups seen ' confirm the value of the program. Specific strengths and weaknesses in the individual lessons indicate needed revisions and provide information useful in tape selection and utilization.

Recommendations resulting from this evaluation are of three types

- (1) those concerning the process; (2) those concerning decisions about the program; and (3) those for further evaluation.
 - 1. Recommendations concerning the process:
 - a. The feasibility of conducting a study such as this one should be determined before the design is firmly established. Inability to procure a control group and the lack of control over many variables caused numerous changes during the evaluation and limited the usefulness of the results.
 - b. More lead-time should be provided for such studies. The delay in contracting with an evaluator, the availability of materials for use in constructing instruments and other such difficulties caused numerous problems in developing and field testing instruments, which led to certain weaknesses in them. The value of lead time is to permit pilot work and field testing to identify problems, and solve them before implementation.
 - 2. Recommendations concerning decisions:
 - a. The results of this evaluation lead to the recommendation that dissemination of the program should continue.

 Acceptance by both students and faculty combined with significant improvement by all involved support this recommendation.
 - b. Comments made in this study indicate that individual tapes may be used more frequently than the entire series. These tapes should be packaged and made available either individually or in groups related to a single topic, so that this option is available to potential users.*
 - 3. Recommendations concerning further evaluation:

The limitations of the present evaluation, pointed out previously, result in the need for further study:

*Note: Individual telelessons may be purchased through the Division of Instructional Television, MSDE.

- a. To compare the effectiveness of this program with a control group under carefully controlled conditions.
- b. To evaluate even more carefully the strengths and weaknesses of individual lessons for the purpose of revision, elimination and improved implementation.
- c. To evaluate the feasibility of using these telelessons totally or in part in a variety of ways, such as independent study, through public broadcasting, and in large group settings.

ADDENDUM

In order to share the results of the project evaluation and the experience of Higher Education participants, two national conferences were held in August of 1975. One representative from each state in the five eastern regions met in Nashville and the representatives from the western states met in Denver.

Each conference involved two days of demonstration projects, feedback, participant sharing and interaction. Because these seemed important and useful in planning continued use of the series, <u>Basic Education</u>: <u>Teaching the Adult</u>, they are listed below:

- 1. Use of all 30 telelessons during a quarter or semester appears unnecessary because:
 - a. Too little time is left for discussion.
 - b. Opportunity to fully develop topics and concepts is hampered.
 - c. Presentation of outside sources to classes is restricted.
 - d. Overuse of television time results in student boredom and lack of proper course development.
- 2. Telelessons are best used as supplemental and reinforcing components of an instructional program.
- 3. Selective use of telelessons allows tailoring of courses to specific student needs.
- 4. Inservice application of telelesson may be the most appropriate way to train ABE teachers since university classes often have more generalized population which do not need some of the curriculum information in the series.
- 5. Careful previewing is essential.
- 6. Action-oriented student projects (including responsibilities for teaching one of the lessons) seems to result in more effective use of the program.

7. Students who reviewed the lessons on individualized basis ofter needed to discuss points of the telelesson.

In only a few cases will the courses be repeated in its entirety in institutions participating in the project. The majority of workshop participants felt that the telelessons could be used most effectively individually or in modules when appropriate to specific courses. The fact that many cours—were offered as experimental, and were not a part of the approved course list of college departments, also seemed to account for these reactions.

APPENDIX A

FORMS USED FOR COLLECTING DATA

ABE/ITV

Course Information (to be completed by the course instructor)

Nam	e of Institution
Ins	tructor
	rse Title
app	ase answer the following questions by putting a circle around the ropriate response, checking the appropriate space or writing in the essary information.
1.	Is the course offered for credit? YesNo
2.	How many credits do students receive? 1 2 3 4 5
3.	What type of credit is given?
	Semester hours Inservice Other Quarter hours Continuing Educ.Unit
4.	Wha level is this credit?
	Undergraduate Graduate Both Other
5.	How many weeks does the class meet?
	7 8 9 10 11 12 13 14 15 16 17
6.	Which day(s) do(es) this class meet?
	Monday Tuesday Wednesday Thursday Friday Saturday Sunday
7.	How many minutes long is each class period?
8.	When does the class meet?
	Before 12:00 noon Between 3:30 and 6:45 p.m. Other Between 3:30 and 6:45 p.m. After 6:45 p.m.
9.	Where is the class held?
	On main campus

10.	In what facility is the class held?	
	Regular classroom TV studio	Learning center or library
11.	What video equipment is used?	
	self-contained playback unit in o monitors in one facility, playbac Other_	k unit in another
12.	Who operates the video equipment?	
	Instructor Technician Volunteer	Individual students Other
13.	Do you plan to preview the tapes before	using them?
	All of themSome of themNone of them	
14.	When are the tapes viewed?	
	In the class	Out of class
	at a scheduled time on student demand	at a scheduled time on student demand
15.	How are the student manuals used?	
	Required reading before viewing ta Required reading after viewing tap Optional reading Other	ape oe
16.	How many students are enrolled in the	class?
17.	Do you have a course outline or syllab	us for the course?
	Yes	
	If so, would you please enclose a copy	with this form.
